Telegram: @wh1te26

Location: Moscow

Citizenship: Russia, work permit: Russia

Willing to relocate: Saint Petersburg, available for business trips

DESIRED POSITION AND SALARY

Senior Frontend Developer (React)

Specializations: — Programmer, Developer

Employment type: full-time

Work format: on-site, remote, hybrid

Preferred commute time: doesn't matter

WORK EXPERIENCE — 5 YEARS 6 MONTHS

January 2026 — Present (6 months)

HeidelbergCement Rus

Saint Petersburg · IT, systems integration, internet · Software development

Senior Frontend Developer (React)

Designed the client application architecture from scratch using Feature-Sliced Design (FSD): built a scalable layer and segment structure on React + TypeScript, which doubled the speed of implementing and extending new features compared to previous projects without an architectural approach.

Set up auto-generation of client contracts from backend services' OpenAPI specifications: implemented type and API client code generation for React + TypeScript, eliminating type mismatches between frontend and backend and reducing integration bugs by a third.

Implemented MobX for state management in key application modules: moved equipment-tracking domain logic into reactive stores, simplifying state synchronization between screens and reducing related bugs by a quarter.

Introduced AI tools (Cursor, Copilot) into routine development tasks: automated boilerplate code, test, and documentation writing, cutting the team's time to implement standard features by a third.

Integrated an AI agent into the code review pipeline via pre-push hooks: set up automatic pull request checks before human review, nearly doubling the code review cycle speed and reducing missed production bugs by a quarter.

Set up end-to-end testing of critical user scenarios with Playwright: covered equipment admission and blocking scenarios with tests, reducing post-release regressions by a third.

January 2023 — January 2026 (3 years 1 month)

Rostelecom Group / Solar Security JSC

Moscow, rt-solar.ru · IT, systems integration, internet · Software development

Senior Frontend Developer

Project: "Cybermir" — a high-load platform for cyber threat modeling and simulation

Developed a comprehensive network attack visualization component on the Canvas API: implemented custom entity rendering instead of a DOM-based approach, boosting render performance from 15–20 FPS to a stable 60 FPS with 10,000+ entities on screen.

Implemented a realtime layer via SSE and Service Workers: stabilized connections under heavy load during peak sessions, reducing disconnects by a third according to monitoring data over the 3 months following implementation.

Built an internal component library documented in Storybook: created 20+ reusable components on Vue 3 + TypeScript, speeding up new screen development by a quarter compared to average feature implementation time before/after.

Migrated the codebase from Vue 2 Options API to Vue 3 Composition API: rewrote key modules while preserving business logic, lowering the entry barrier for new developers and cutting team onboarding time in half.

Introduced TypeScript into the existing codebase: typed API services and application components, reducing production runtime errors by a third according to Sentry data over 2 quarters.

Migrated state management from Vuex to Pinia: simplified the state module architecture and removed redundant boilerplate, cutting state-layer code volume by 40% compared to lines of code before/after.

April 2022 — January 2023 (10 months)

OKENIT

Saint Petersburg · IT, systems integration, internet · Software development

Frontend Developer (React)

Projects: Statistics and analytics visualization systems; geodata storage and visualization system for a government agency

Implemented mapping interfaces with OpenLayers + React combined with D3.js analytical visualization: configured rendering of 500+ markers with clustering, ensuring smooth map performance without slowdowns as data volume grew several times over.

Implemented a GraphQL layer for client-backend communication with analytics services: replaced part of the REST requests with typed GraphQL queries tailored to specific dashboards, reducing redundant data in API responses and nearly halving the number of requests per screen load.

Set up unit and end-to-end testing with Vitest and Playwright: covered 70% of the project's critical business scenarios with tests, reducing post-release regressions by a quarter.

Built a set of reusable UI components documented in Storybook: unified the project's visual interface elements, speeding up the team's new screen development twofold.

Prepared technical project documentation in GitBook: described the system's architecture and key modules, cutting new team member onboarding time in half.

Supported and developed new functionality for the company website on Next.js: implemented a number of client-side features and fixed critical defects, reducing user-reported technical issues by a third.

January 2021 — April 2022 (1 year 4 months)

Mentalstack

Taganrog · IT, systems integration, internet · Software development

Frontend Developer (React)

Project: Kanban task management web application and time tracker

Designed the realtime task board update architecture via WebSockets: implemented custom composables for client reconnection and synchronization, ensuring consistent board state across all users in real time without manual page refreshes.

Implemented MobX for global application state management: moved the task board and time tracker domain logic into reactive stores, reducing inconsistent UI states and related bugs by a third.

Built key task board UI components (cards, columns, drag-and-drop): implemented interactive task movement between statuses, cutting the average time for a user to create a task in half.

Integrated the time tracker client with the backend API: implemented real-time time tracking per task, improving the accuracy of the team's work-time tracking and reducing discrepancies with manual tracking by a third.

EDUCATION

Higher education

2022

Peter the Great St. Petersburg Polytechnic University, Saint Petersburg

Institute of Computer Science and Technology, Instrument Engineering

SKILLS

Language proficiency: Russian — Native

Key skills:

JavaScript TypeScript Git React HTML5 Node.js CSS3 HTML Vite Webpack OpenAPI
Docker CI/CD Next.js Redux MobX Vitest Storybook Playwright Babel GraphQL REST API
WebSocket SSR ReactJS Linux

ADDITIONAL INFORMATION

About me

GitHub: <https://github.com/White11010>

Portfolio and tech blog: <https://vladislav-belyavsky.vercel.app/>

Frontend developer with 5+ years of commercial experience, specializing in projects where architecture and performance directly impact business outcomes. I implement scalable architectural approaches (FSD) that shorten time-to-market for new features and lower their maintenance cost. I solve problems that a typical DOM-based approach can't handle: building interfaces for high-load scenarios with large volumes of realtime data, and stabilizing connections under heavy load. I build engineering processes from scratch — testing, code review, design systems — which reduces production bugs and speeds up onboarding for new developers on the team. I actively integrate AI tools into development and code review, shortening the

feature release cycle and freeing up the team's time from routine work for more complex tasks.
